

AAV-PHP.eB enables efficient transduction of neurons and astrocytes throughout the CNS at lower virus doses

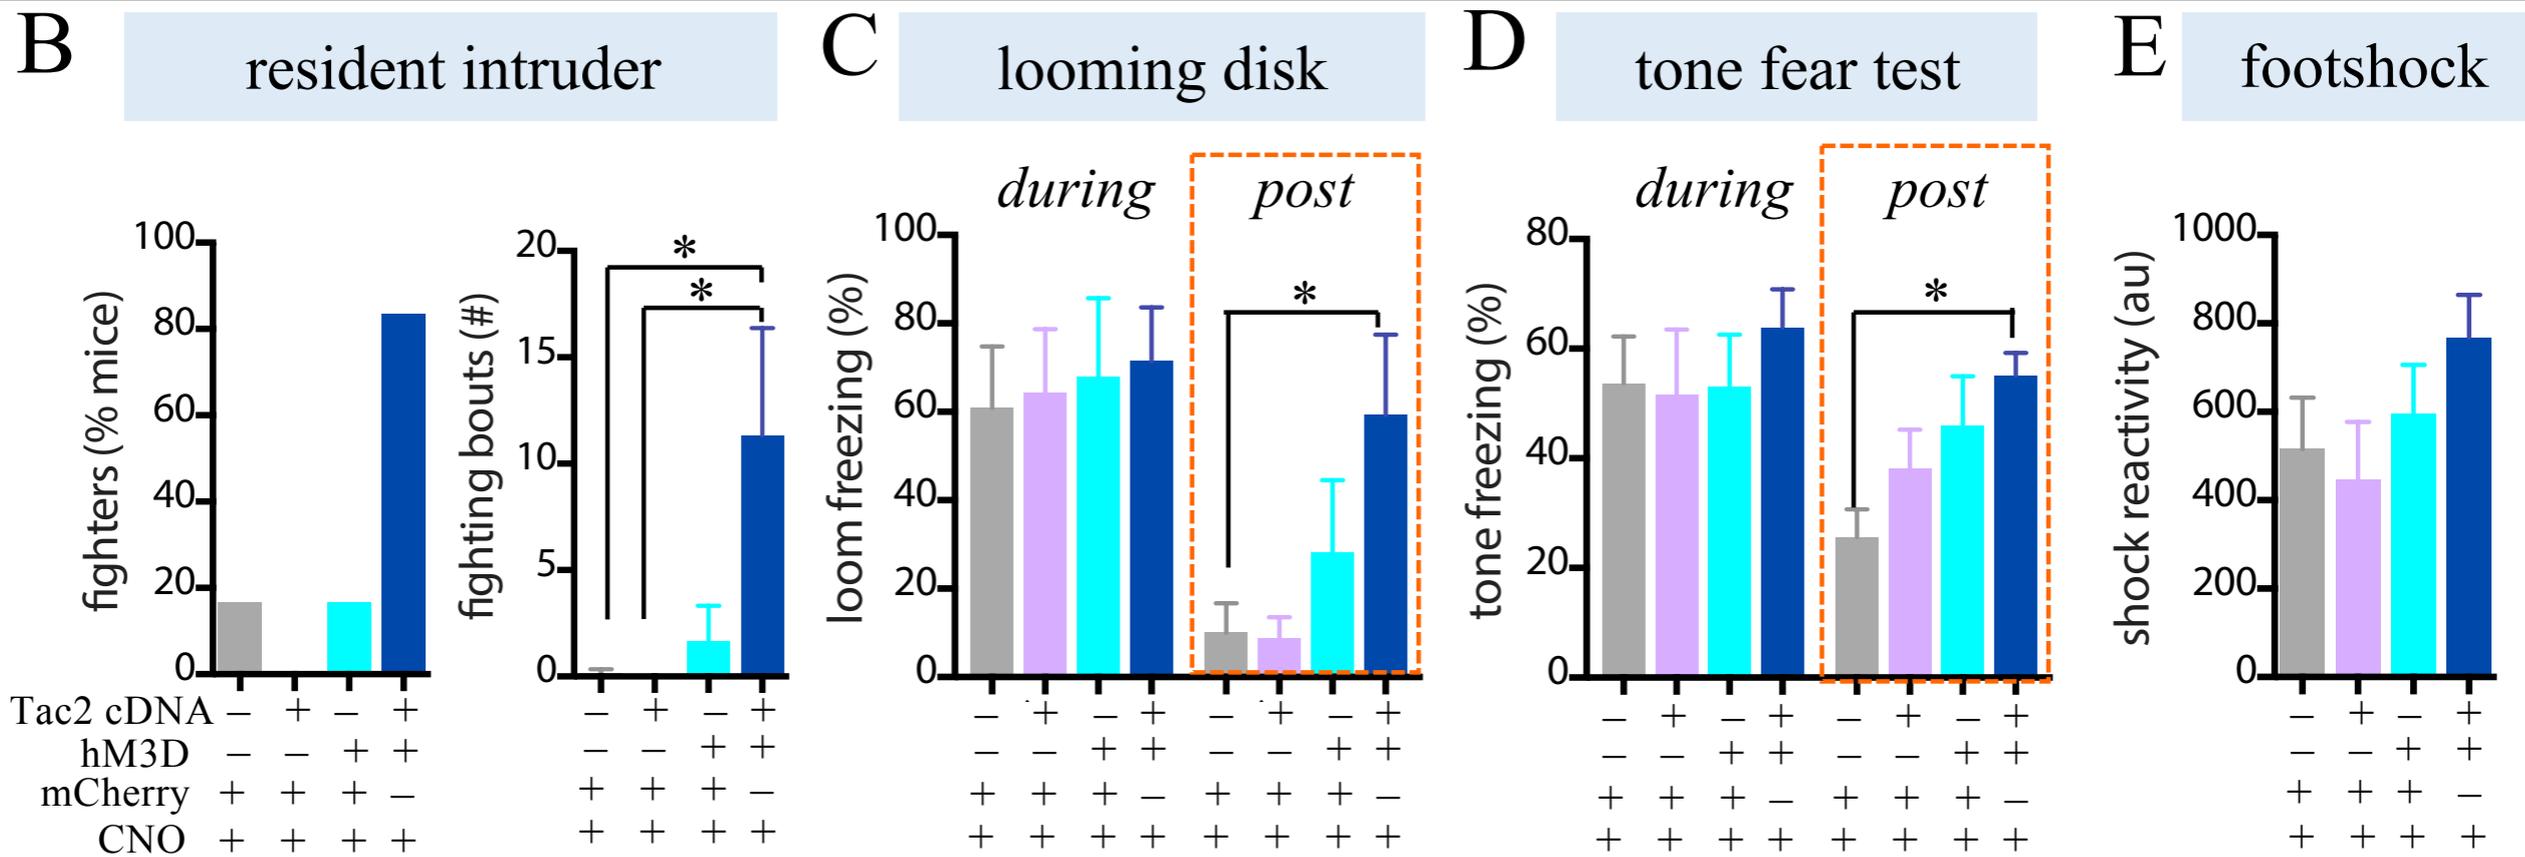

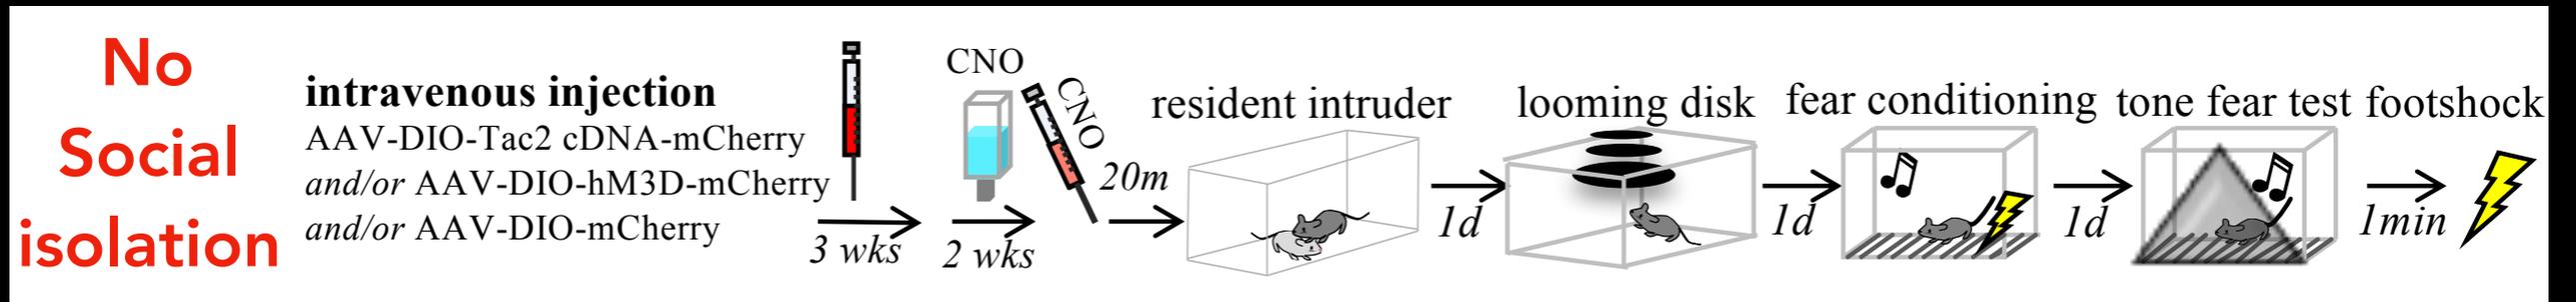

Chronic social isolation stress induces widespread increases in the Tac2 neuropeptide

Prolonged social isolation stress causes a dramatic upregulation of the Tac2 neuropeptide

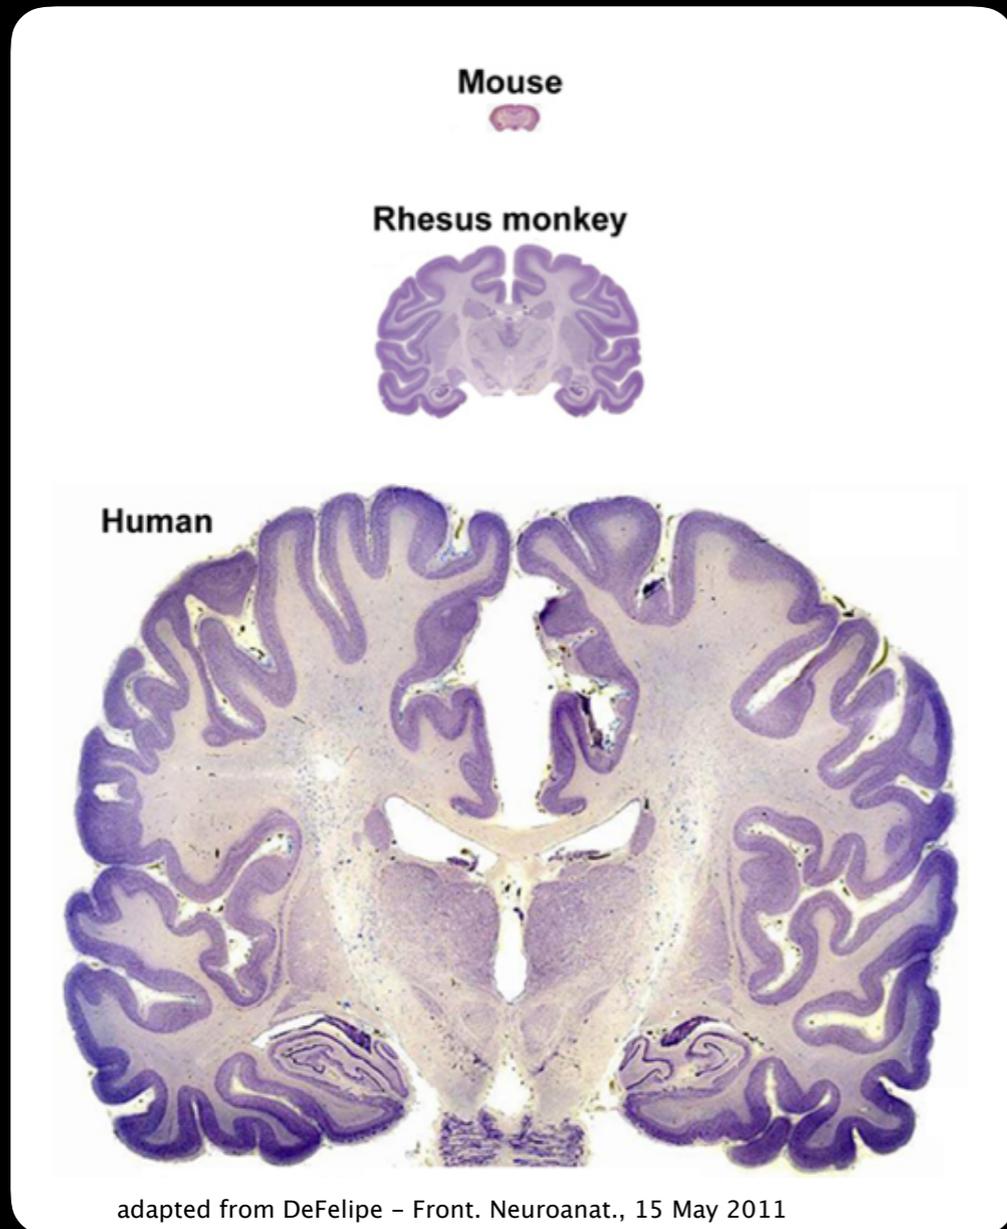

Can the effects of the stress be mimicked through circuit modulation using chemogenetics?

Will the PHP.B vectors work beyond the mouse?

Challenges for gene delivery to the CNS

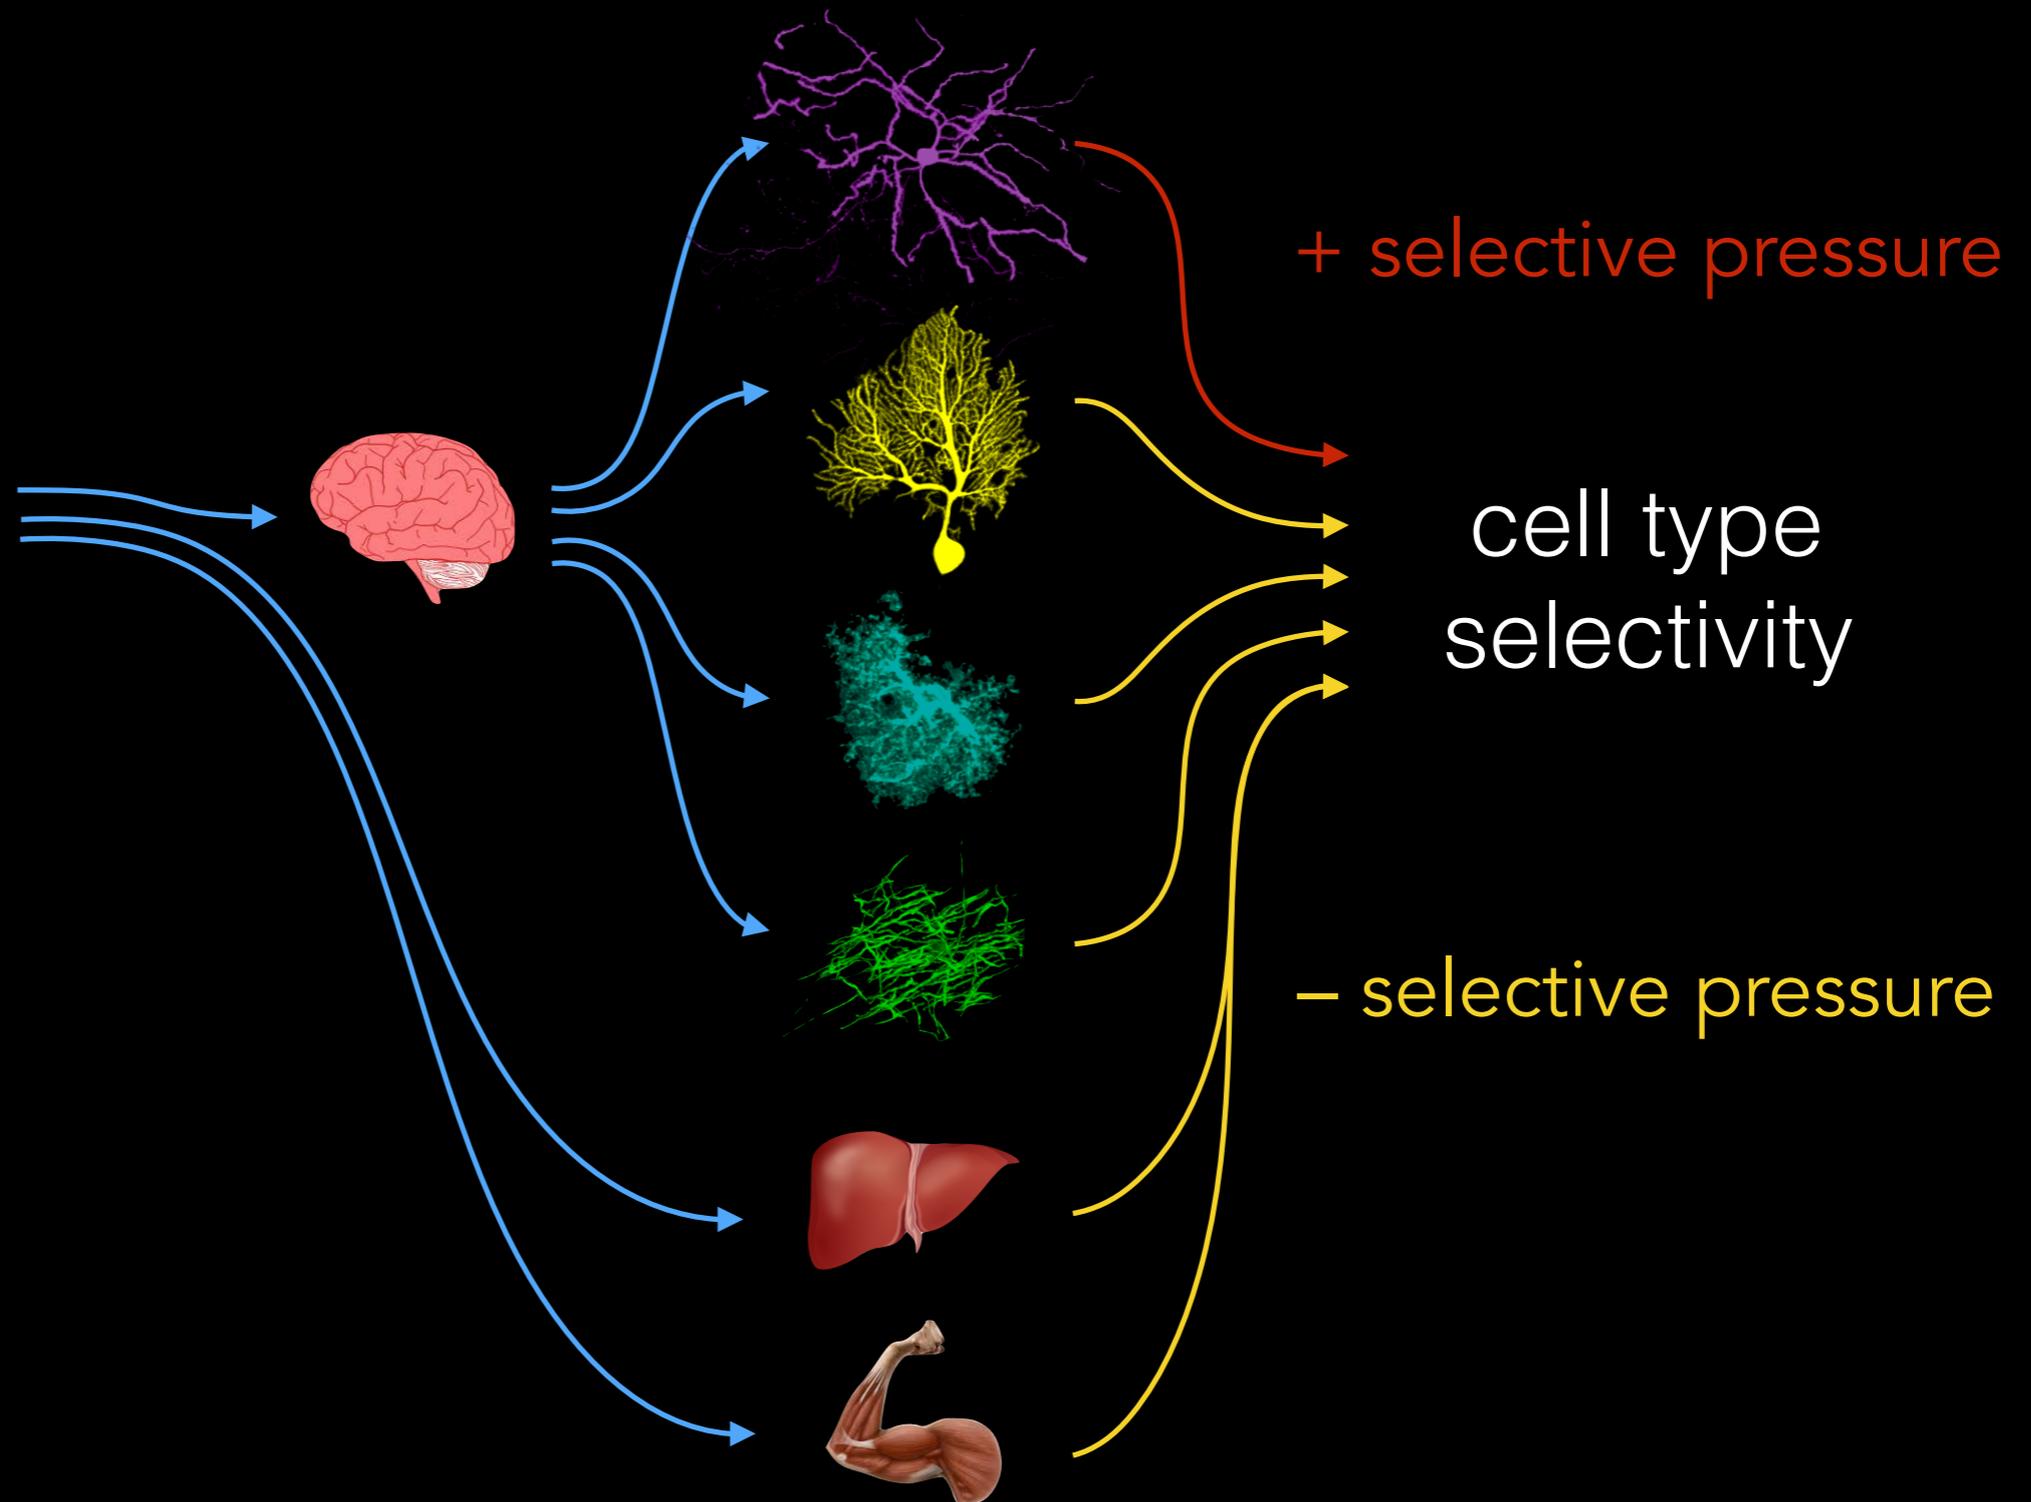

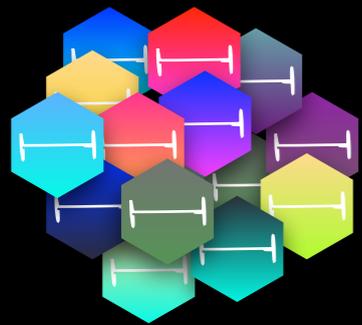

Objectives

- Develop vehicles for safe and efficient noninvasive CNS-wide gene transfer
- Enable targeted gene expression in specific neuronal and glial populations
- Develop improved intersectional strategies for specific circuits
- Avoid immune responses to foreign transgenes and viral components

CREATE2.0: *in vivo-in silico* selection for improved AAV variants
